Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Complete genome sequence of Caulobacter crescentus.";
Proc. Nacl. Acad. Sci. U.S.A. 98:4136-4141(2001).
-!- FUNCTION: This enzyme is an endonuclease that degrades the RNA RNA-DNA hybrids specifically (By similarity).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-
                                                                                                                                                                                                                                                                                                   proteome.

                                                                                                                                                                                                                                                                                                                                                                                   -i- FUNCTION: Involved in the formation of 2-(5''-phosphoribosyl)-3'-dephosphocoenzyme-A, the prosthetic group of the acyl-carrier protein of the malonate decarboxylase (By similarity).
-!- CATALYTIC ACTIVITY: ATP + 3-dephospho-CoA = 2'-(5''-triphosphoribosyl)-3'-dephospho-CoA + adenine.
-!- SIMILARITY: Belongs to the citG/mdcB family.
                                                               16-OCT-2001 (Rel. 40, Last sequence update)
10-OCT-2003 (Rel. 42, Last annotation update)
Probable 2-(5''-triphosphoribosyl)-3'-dephosphocoenzyme-A synthase
(EC 2.7.8.25) (2-(5''-triphosphoribosyl)-3'-dephospho-CoA synthase)
MDCB OR PA0209.

The Transfer Fractin I. Mucation in a German Kindred with meebmain B corneal dystrophy.";

Br. J. Ophthalmol. 84:527-530(2000).

-!- FUNCTION: May play a unique role in maintaining the normal corneal epithelial function (By similarity).

-!- SUBUNIT: Heterotetramer of two type I and two type II keratins.

Keratin 3 associates with keratin 12.

-!- TISSUE SPECIFICITY: Cornea specific.

-!- DISEASE: Defects in KRT12 are a cause of juvenile epithelial corneal dystrophy of Meesmann (MCD) [MIM:122100]. MCD is an autosomal dominant disease that causes fragility of the anterior corneal epithelium. Patients are usually asymptomatic until adulthood when rupture of the corneal microcysts may cause erosions, producing clinical symptoms such as photophobia, contact lens intolerance and intermittent diminution of visual acuity.

Rarely, subepithelial scarring causes irregular corneal astigmatism and permanent visual impairment. Histological examination shows a disorganized and thickened epithelium with with examination shows a disorganized and thickened epithelium with examination shows a disorganized and thickened epithelium with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. --- MISCELLAMBOUS: There are two types of cytoskeletal and microfibrillar Keratin, I (acidic) and II (neutral to basic) (40-55 and 56-70 kDa, respectively).
--- SIMILARITY: Belongs to the intermediate filament family.
Kinoshita S.; and chromosomal localization of a cornea-specific human "Isolation and detection of four mutations in Meesmann corneal epithelial dystrophy.";

EXTRACELLULAR (POTENTIAL).
TISSUE SPECIFICITY: Weakly expressed in most tissues, except in brain. Expressed at intermediate level in brain, including cerebellum, substantia nigra, thalamus, spinal cord, hippocampus and fetal brain. Also expressed in testis.

SIMILARITY: Belongs to the CSMD family.

SIMILARITY: Contains 14 CUB domains.

SIMILARITY: Contains 19 Sushi (SCR) domains.
                                                                                                                                                                                                                                                                                                                                    EMBL; AV210419; AA034702.1; -...

Phospholipase A(2) with platelet aggregation inhibitor activity from Austrelaps superbus venom: protein purification and cDNA cloning.";
Arch. Biochem. Biophys. 375:289-303(2000).
-!- FONCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-sn-phosphoglycerides. Inhibits collagen-induced platelet aggregation (By similarity).
-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)O = 1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

May bind to and inhibit cyclin-dependent kinase activity, preventing phosphorylation of critical cyclin-dependent kinase substrates and blocking cell cycle progression. SUBCELLULAR LOCATION: Nuclear. INDUCTION: By p53, mezerein (antileukemic compound) and interferon
                                                                                                                                                           01-FEB-1995 (Rel. 31, Created)
01-CCT-1996 (Rel. 34, Last sequence update)
10-CCT-2003 (Rel. 42, Last annotation update)
Cyclin-dependent kinase inhibitor 1 (p21) (CDK-interacting protein 1)
(Melanoma differentiation associated protein).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Piri A.-

T and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002)

L FUNCTION: Component of the asymmetric unit membrane (AUM); a highly specialized biomembrane elaborated by terminally differentiated urothelial cells. May play an important role in AUM-cycoskeleton interaction in terminally differentiated urothelial glycocalyx which may play an important role in preventing bacterial adherence (By smillarity).

-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

Heterodimer formation with Uroplakin Ib.

-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

Heterodimer formation with Uroplakin Ib is a prerequisite to exit out of the endoplasmic reticulum (ER).

-!- CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 210.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Richards S., Worley K.C., Hale S., García A.M., Gay L.J., Hulyk S.W., Villalon D.K., Muzny D.M., Sodergren E.J., Lu K., Gibbs R.A., Villalon D.K., Muzny D.M., Sodergren E.J., Lu K., Gibbs R.A., Whiting W., Madan A.Y., Young A.C., Shevchenko Y., Bouffard G.G., Blakesley R.W., Touchman J.W., Green E.D., Dickson M.C., Rodriguez A.C., Grimwood J., Schmutz J., Myers R.M., Butterfield Y.S.N., Krzywinski M.I., Skalska U., Smailus D.E., Schnerch A., Schein J.E., Jones S.J.M., Marra M.A., Generation and initial analysis of more than 15,000 full-length human

                                                                                                                                                                                                                                                                                                                                                                                                                               "Genome Bequences v.
pneumoniae AR39.";
Nucleic Acids Res. 28:1397-1406(2000).

-!- FUNCTION: The ruvA-ruvB complex in the presence of ATP renatures cruciform structure in supercoiled DNA with palliadronic sequence, indicating that it may promote strand exchange reactions in homologous recombination. RuvAB is an helicase that mediates the Holliday junction migration by localized denaturation and reanneling (By similarity).
-!- SUBUNIT: Forms a complex with ruvA (By similarity).
-!- SIMILARITY: Belongs to the ruvB family.

RunAB is an helicase that mediates the Holliday junction migration by localized denaturation and seanelling (By similarity).

SUBUNIT: Forms a complex with runA (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA repair; SOS response; ATP-binding; DNA recombination; Helicase;
